COMS W4111-003/V003 (Fall 2022) Introduction to Databases

Homework 4: Both Tracks

Setup Environment

MySQL

```
In [1]:   %load_ext sql
```

```
In [2]:   import pymysql
```

```
In [3]:   %sql mysql+pymysql://root:1168622jin@localhost
```

```
In [4]:   #
          # Note that your list of databases will be different.
          #
          %sql show databases;
```

```
 * mysql+pymysql://root:***@localhost
11 rows affected.
```

Out[4]:

Database
4111
classicmodels
databases_4111
db_book
f22_midterm
information_schema
lahman
lahmansbaseballdb
mysql
performance_schema
sys

In [7]:
```python
import pymongo
```

In [9]:
```python
from pymongo import MongoClient, InsertOne
```

In [25]:
```python
client = pymongo.MongoClient("mongodb+srv://root:dbuserdbuser@cluster0.7sm35j5.mongodb.net/?retryWrites=true&w=majorit
db = client['GoT']
collection = db['episodes']
```

In [30]:
```python
file = open("./data/episodes.json")
episodes = json.load(file)
client = pymongo.MongoClient("mongodb+srv://root:dbuserdbuser@cluster0.7sm35j5.mongodb.net/?retryWrites=true&w=majorit
db = client['GoT']
collection = db['episodes']
if isinstance(episodes, list):
    collection.insert_many(episodes)
else:
    collection.insert_one(episodes)
```

Neo4j

- This section assume that you have set up Neo4j on Aura DB, installed the Movie database and that your interest is running. If you do not use your instance for a while, Aura suspends it. You will have to login and restart it.

- Since these are cloud databases, I put my credentials in a file instead of a notebook that I share with everyone and place on GitHub. You will have to set the correct information for your instances.

```python
In [5]:    import sys
           sys.path.append('/Users/donaldferguson/Dropbox/00NewProjects/F22-W4111-HW4')
```

```python
In [287…   import sys
```

```python
In [49]:   import my_secrets
```

- You may have to install `py2neo` using pip or Conda.

```python
In [ ]:    # !pip install py2neo
```

```python
In [41]:   from py2neo import Graph
```

```python
In [44]:   aura_url = my_secrets.aura_url
           aura_user = my_secrets.aura_user
           aura_pw = my_secrets.aura_pw
```

```python
In [288…   def t1():
               graph = Graph(aura_url, auth=(aura_user, aura_pw))
               q = "match (r:Person) where r.name='Tom Hanks' return r"
               res = graph.run(q)

               for r in res:
                   print(r)
```

```python
In [289…   t1()
```

MongoDB

- This section assume that you have set up MongoDB on Atlas.

- You need to follow instructions to enable connecting from a remote Python application.

- You also need to pip/Conda install pymongo.

- You will have to your URL for connecting.

```
In [ ]:   #!pip install pymongo
```

```
In [290…  import pymongo
```

```
In [291…  import my_secrets
```

```
In [292…  def connect():
              client = pymongo.MongoClient(
                  #my_secrets.mongodb_url
                  "mongodb+srv://root:dbuserdbuser@cluster0.7sm35j5.mongodb.net/?retryWrites=true&w=majority"
              )
              return client

          def t_connect():
              c = connect()
              print("Databases = ", list(c.list_databases()))
```

```
In [293…  # Your list of databases will be different. It may, be empty.
          t_connect()
```

```
Databases =  [{'name': 'GoT', 'sizeOnDisk': 262144, 'empty': False}, {'name': 'hw4', 'sizeOnDisk': 507904, 'empty': Fa
lse}, {'name': 'testdb', 'sizeOnDisk': 73728, 'empty': False}, {'name': 'admin', 'sizeOnDisk': 385024, 'empty': Fals
e}, {'name': 'local', 'sizeOnDisk': 8446685184, 'empty': False}]
```

- The following will do some additional testing.

```
In [77]:  client = pymongo.MongoClient(
                  "mongodb+srv://root:dbuserdbuser@cluster0.7sm35j5.mongodb.net/?retryWrites=true&w=majority"
              )
```

```
In [78]:  client["testdb"]["testcollection"].insert_one(
              {
                  "class": "W4111",
                  "is_cool": True
              }
          )
```

Out[78]: `<pymongo.results.InsertOneResult at 0x7ff68b654730>`

```
In [79]:  client["testdb"]["testcollection"].insert_one(
              {
                  "professor": "Ferguson",
                  "is_cool": "Seriously? Are you kidding me? Heck NO!"
              }
          )
```

Out[79]: `<pymongo.results.InsertOneResult at 0x7ff6899337f0>`

```
In [80]:  res = client["testdb"]["testcollection"].find()
```

```
In [81]:  some_info = list(res)
          some_info
```

Out[81]:
```
[{'_id': ObjectId('6398e694918630bc14ca6717'),
  'class': 'W4111',
  'is_cool': True},
 {'_id': ObjectId('6398e6e8918630bc14ca6718'),
  'professor': 'Ferguson',
  'is_cool': 'Seriously? Are you kidding me? Heck NO!'}]
```

Common Tasks for Both Tracks

Load MongoDB Atlas

- The project contains two files: `data/characters.json` and `data/episodes.json`.

- The following code snippets will load the information into lists. This is a little tricky because we need to extract the embedded array from the JSON object.

In [103…
```python
import json
```

In [133…
```python
with open ("data/characters.json") as in_file:
    characters = json.load(in_file)
```

In [134…
```python
characters = characters['characters']
```

In [126…
```python
characters[0:3]
```

Out[126]:
```
[{'characterName': 'Addam Marbrand',
  'characterLink': '/character/ch0305333/',
  'actorName': 'B.J. Hogg',
  'actorLink': '/name/nm0389698/'},
 {'characterName': 'Aegon Targaryen',
  'houseName': 'Targaryen',
  'royal': True,
  'parents': ['Elia Martell', 'Rhaegar Targaryen'],
  'siblings': ['Rhaenys Targaryen', 'Jon Snow'],
  'killedBy': ['Gregor Clegane']},
 {'characterName': 'Aeron Greyjoy',
  'houseName': 'Greyjoy',
  'characterImageThumb': 'https://images-na.ssl-images-amazon.com/images/M/MV5BNzI5MDg0ZDAtN2Y2ZC00MzU1LTgyYjQtNTBjYj
EzODczZDVhXkEyXkFqcGdeQXVyNTg0Nzg4NTE@._V1._SX100_SY140_.jpg',
  'characterImageFull': 'https://images-na.ssl-images-amazon.com/images/M/MV5BNzI5MDg0ZDAtN2Y2ZC00MzU1LTgyYjQtNTBjYjE
zODczZDVhXkEyXkFqcGdeQXVyNTg0Nzg4NTE@._V1_.jpg',
  'characterLink': '/character/ch0540081/',
  'actorName': 'Michael Feast',
  'actorLink': '/name/nm0269923/',
  'siblings': ['Balon Greyjoy', 'Euron Greyjoy'],
  'nickname': 'Damphair'}]
```

In [131…
```python
with open ("data/episodes.json") as in_file:
    episodes = json.load(in_file)
```

In [132… ```
          episodes = episodes['episodes']
          ```

- You now have two lists in the notebook. Save the documents in the array to Atlas using databases name `hw4`. You must write Python code using `pymongo` to load the data.

- Put your code in the cells below and execute it.

In [135…
```python
# Your code here.
client = pymongo.MongoClient("mongodb+srv://root:dbuserdbuser@cluster0.7sm35j5.mongodb.net/?retryWrites=true&w=majorit
db = client['hw4']
collection = db['characters']
if isinstance(characters, list):
    collection.insert_many(characters)
else:
    collection.insert_one(characters)
```

- The following code will test that you have loaded the information.

In [136…
```python
ep = client['hw4']['episodes'].find_one(
    {"seasonNum": 1, "episodeNum": 1}
)
```

In [137…
```python
ep
```

```
Out[137]:  {'_id': ObjectId('6398e7dc918630bc14ca6719'),
           'seasonNum': 1,
           'episodeNum': 1,
           'episodeTitle': 'Winter Is Coming',
           'episodeLink': '/title/tt1480055/',
           'episodeAirDate': '2011-04-17',
           'episodeDescription': "Jon Arryn, the Hand of the King, is dead. King Robert Baratheon plans to ask his oldest frien
       d, Eddard Stark, to take Jon's place. Across the sea, Viserys Targaryen plans to wed his sister to a nomadic warlord
       in exchange for an army.",
           'openingSequenceLocations': ["King's Landing",

```

```
              {'name': 'Theon Greyjoy'},
              {'name': 'Bran Stark'},
              {'name': 'Robb Stark'},
              {'name': 'Rodrik Cassel'},
              {'name': 'Jory Cassel'},
              {'name': 'Grey Wind'},
              {'name': 'Lady'},
              {'name': 'Nymeria'},
              {'name': 'Summer'},
              {'name': 'Shaggydog'},
              {'name': 'Ghost'}]},
            {'sceneStart': '0:18:44',
             'sceneEnd': '0:20:45',
             'location': 'The Crownlands',
             'subLocation': "King's Landing",
             'characters': [{'name': 'Jon Arryn',
               'alive': False,
               'title': 'Hand',
               'mannerOfDeath': 'Poison',
               'killedBy': ['Lysa Arryn']},
              {'name': 'Cersei Lannister'},
              {'name': 'Jaime Lannister'}]},
            {'sceneStart': '0:20:45',
             'sceneEnd': '0:22:43',
             'location': 'The North',
             'subLocation': 'Winterfell',
             'characters': [{'name': 'Catelyn Stark'},
              {'name': 'Eddard Stark', 'weapon': [{'action': 'has', 'name': 'Ice'}]}]},
            {'sceneStart': '0:22:43',
             'sceneEnd': '0:23:09',
             'location': 'The North',
             'subLocation': 'Winterfell',
             'characters': [{'name': 'Catelyn Stark'}, {'name': 'Maester Luwin'}]},
            {'sceneStart': '0:23:09',
             'sceneEnd': '0:23:39',
             'location': 'The North',
             'subLocation': 'Winterfell',

Load MySQL

- The `data` directory contains 5 CSV files:
  - `got_cast.csv`
  - `got_cast_details.csv`
  - `got_episodes.csv`
  - `got_title_ratings.csv`
  - `got_title_cast.csv`

- Create a MySQL databases `w4111_f22_hw4` and load the CSV files. You should use Pandas to load and save the information.

- Put your code in the cells below and execute it.

In [294…]:
```sql
%%sql

drop database if exists w4111_f22_hw4;
create database w4111_f22_hw4;
```

```
 * mysql+pymysql://root:***@localhost

id	seasonNum	episodeNum	episodeTitle	episodeLink	episodeAirDate	episodeDescription
0	1	1	Winter Is Coming	/title/tt1480055/	2011-04-17	Jon Arryn, the Hand of the King, is dead. King Robert Baratheon plans to ask his oldest friend, Eddard Stark, to take Jon's place. Across the sea, Viserys Targaryen plans to wed his sister to a nomadic warlord in exchange for an army.
1	1	2	The Kingsroad	/title/tt1668746/	2011-04-24	While Bran recovers from his fall, Ned takes only his daughters to King's Landing. Jon Snow goes with his uncle Benjen to The Wall. Tyrion joins them.
2	1	3	Lord Snow	/title/tt1829962/	2011-05-01	Lord Stark and his daughters arrive at King's Landing to discover the intrigues of the king's realm.
3	1	4	Cripples, Bastards, and Broken Things	/title/tt1829963/	2011-05-08	Eddard investigates Jon Arryn's murder. Jon befriends Samwell Tarly, a coward who has come to join the Night's Watch.
4	1	5	The Wolf and the Lion	/title/tt1829964/	2011-05-15	Catelyn has captured Tyrion and plans to bring him to her sister, Lysa Arryn, at The Vale, to be tried for his, supposed, crimes against Bran. Robert plans to have Daenerys killed, but Eddard refuses to be a part of it and quits.
5	1	6	A Golden Crown	/title/tt1837862/	2011-05-22	While recovering from his battle with Jaime, Eddard is forced to run the kingdom while Robert goes hunting. Tyrion demands a trial by combat for his freedom. Viserys is losing his patience with Drogo.
6	1	7	You Win or You Die	/title/tt1837863/	2011-05-29	Robert has been injured while hunting and is dying. Jon and the others finally take their vows to the Night's Watch. A man, sent by Robert, is captured for trying to poison Daenerys. Furious, Drogo vows to attack the Seven Kingdoms.
7	1	8	The Pointy End	/title/tt1837864/	2011-06-05	Eddard and his men are betrayed and captured by the Lannisters. When word reaches Robb, he plans to go to war to rescue them. The White Walkers attack The Wall. Tyrion returns to his father with some new friends.
8	1	9	Baelor	/title/tt1851398/	2011-06-12	Robb goes to war against the Lannisters. Jon finds himself struggling on deciding if his place is with Robb or the Night's Watch. Drogo has fallen ill from a fresh battle wound. Daenerys is desperate to save him.
9	1	10	Fire and Blood	/title/tt1851397/	2011-06-19	With Ned dead, Robb vows to get revenge on the Lannisters. Jon must officially decide if his place is with Robb or the Night's Watch. Daenerys says her final goodbye to Drogo.

Load Neo4j

- You are now going to load some information into Neo4j. Specifically, the Game of Thrones episodes, the Game of Thrones cast, and the Game of Thrones title-cast information.

- You can load the data into the notebook from the RDB using Pandas and SQLAlchemy.

- You will use `py2neo` to do the loading into Neo4j. The functions are later in the notebook.

- I decided to make this easier and give you some helper functions instead of having you figure it out by yourself.

Load SQL into DataFrames

```python
In [219...   import pandas
```

```python
In [220...   from sqlalchemy import create_engine
```

```python
In [243...   engine = create_engine("mysql+pymysql://root:1168622jin@localhost")
```

```python
In [244...   sql_episodes = \
            """
            select seasonNum, episodeNum, episodeTitle,
            substr(episodeLink, 8, length(episodeLink) - 8) as tconst,
            episodeAirDate, episodeDescription
            from w4111_f22_hw4.got_episodes;

            """
```

```python
In [245...   sql_cast_details = \
            """
            select distinct * from w4111_f22_hw4.got_cast_details;
            """
```

```
In [246…  sql_cast_titles = \
          """
          select distinct * from w4111_f22_hw4.got_title_cast;
          """
```

```
In [247…  episodes_df = pd.read_sql(sql_episodes, con = engine)
```

```
In [249…  cast_df = pd.read_sql(sql_cast_details, con = engine)
```

```
In [250…  titles_cast_df = pd.read_sql(sql_cast_titles, con = engine)
```

- The following tests whether or not your loading worked.

```
In [251…  episodes_df
```

Load Data into Neo4j

In [263…
```python
# Up until now, we have been directly using query languages to interact with databases.
# There are many higher layer language libraries that make using the databases "simpler."
# I avoided using these libraries because they obscure what is happening and hide the query language.
# Learning the query language(s) is important.
#
# py2neo and other tools provide an "object-mapping" layers that maps between the data in the databases
# and classes/objects in the programming language you are using. py2neo implements classes Node and Relationship.
#
from py2neo.data import Node, Relationship
```

In [264…
```python
graph = Graph(aura_url, auth=(aura_user, aura_pw))
```

- The following are a couple of helper functions that will simplify the homework.

In [265...
```python
# The matcher classes simplify using the query language from withon Python and classes.
#
from py2neo.matching import *
```

In [266...
```python
def get_nodes(label, template):
    """

    :param label: The label of the node
    :template: A dictionary of property, value pairs to match.
    :return: A list of matching nodes.
    """
    nodes = NodeMatcher(graph)
    the_match = nodes.match(label, **template)
    result = []
    for n in the_match:
        result.append(n)
    return result
```

In [267...
```python
keanu = get_nodes("Person", { "name": "Keanu Reeves" })
```

In [268...
```python
keanu
```

Out[268]: []

In [269...
```python
def create_node(n):

- When I run a query in my Neo4j console, I get the following.

__Simple Query Result

- Your task is to now use your skills and my helper code to load episodes, actors and relationships.

- Please put your code below, and then past some screenshots.

```python
In [278…    episode_data = episodes_df.to_dict('records')
            episode_length = len(episode_data)
            for i in range(episode_length):
                data = episode_data[i]
                episode_node = Node("GOT_Episode", **data)
                create_node(episode_node)
```

```python
In [279…    cast_data = cast_df.to_dict('records')
            cast_length = len(cast_data)
            for i in range(cast_length):
                data = cast_data[i]
                cast_node = Node("GOT_Actor", **data)
                create_node(cast_node)
```

```python
In [286…    titles_cast_list = titles_cast_df.to_dict('records')
            titles_length = len(titles_cast_list)
            for i in range(titles_length):
                actor = get_nodes("GOT_Actor", {"nconst": titles_cast_list[i]["nconst"]})
                actor = actor[0]
                episode = get_nodes("GOT_Episode", {"tconst": titles_cast_list[i]["tconst"]})
                episode = episode[0]
                create_relationship(actor, "GOT_Acted_In", episode,
                                    {"roles": titles_cast_list[i]['characters']})
```

Screenshots are below with all of them in "limit 25" Successfully loaded!

```python
In [310…    from IPython.display import Image
```

```python
In [311…    Image("./1.png")
```

Programming Track

- I am canceling the programming track. I will explain how to use what we just did in a web application, but piling on more work at this point would be cruel.

Non-Programming Track

- I am canceling the non-programming track. I will explain how to use what we just did in data science, but piling on more work at this point would be cruel.
